

Phase 5 : Apex Programming (Developer)

Problem Statement:

Apex is Salesforce's proprietary programming language used to implement custom business logic, automation, and data operations. In a Banking & Financial CRM scenario, Apex enables the bank to handle complex processes that go beyond standard Salesforce configuration.

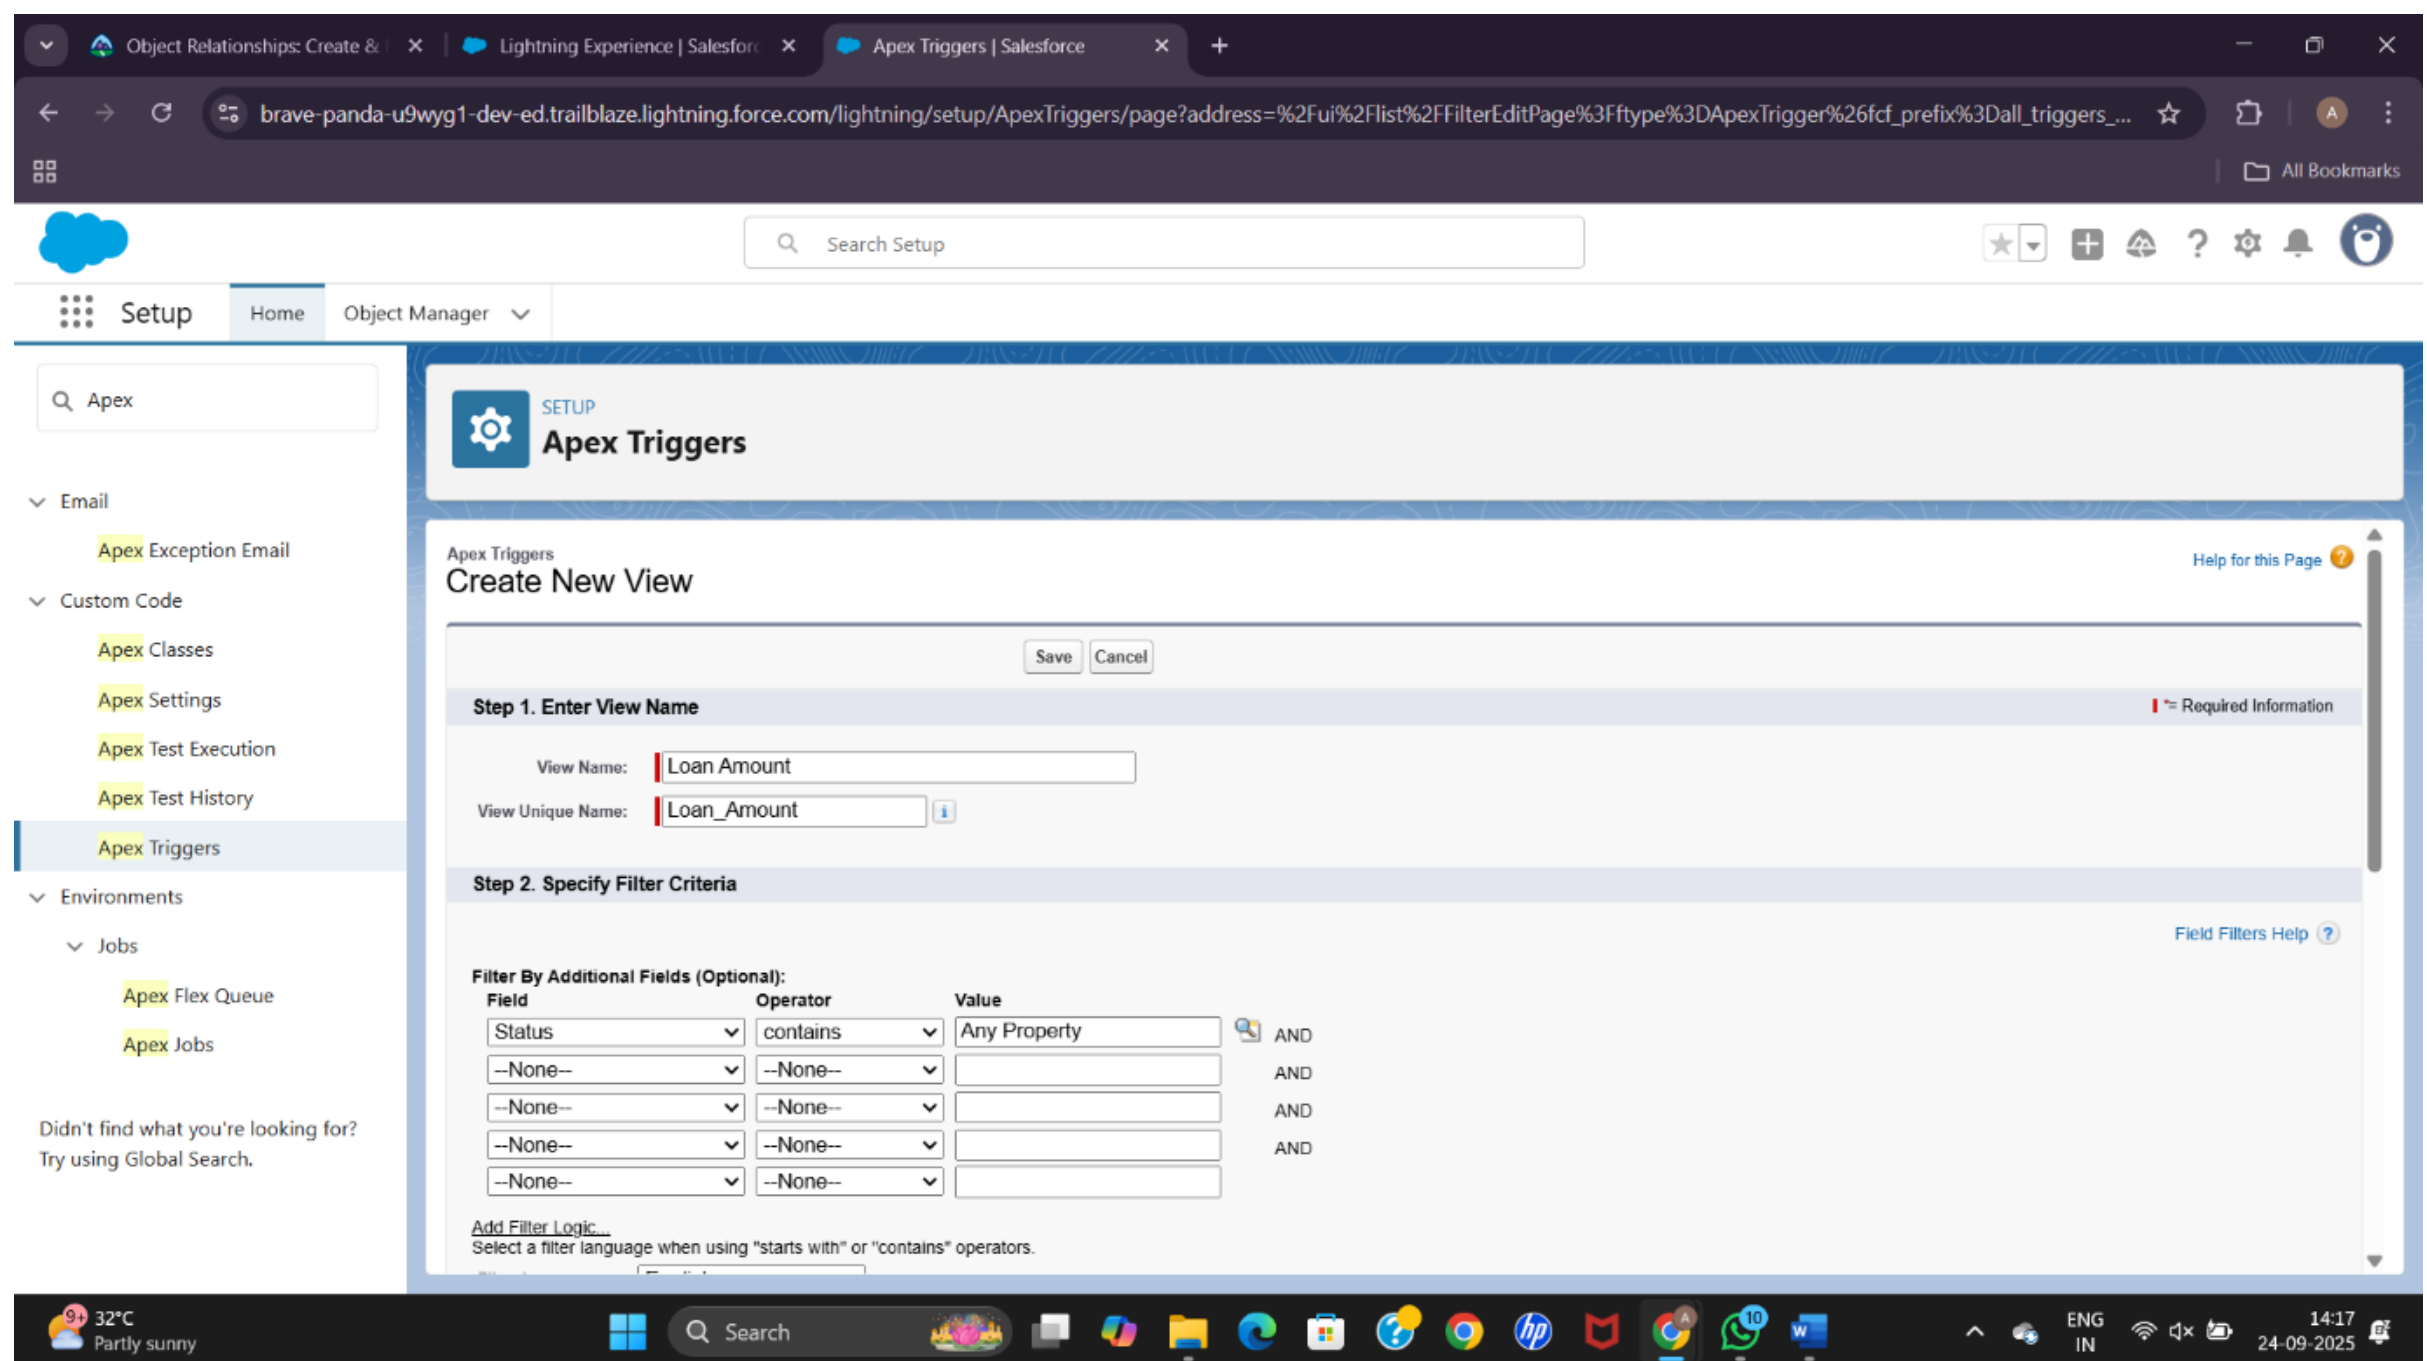

1.Classes & Objects:

- . A class is a blueprint or template in Apex (Salesforce's programming language) that defines properties (variables) and behaviors (methods) for objects.
- . In Banking CRM, a class can represent a Loan, Customer Account, or Service Request process with logic to calculate interest, validate loan status, or generate reports.
- . An object is an instance of a class. It holds real values for the properties defined in the class.

2.ApexTriggers:

- . An Apex Trigger is a piece of Apex code that executes before or after records are inserted, updated, deleted, or undeleted in Salesforce.
- . Automatically update or validate loan, account, or service request records.

Loan Approval: After a Loan record is approved, automatically update the customer account with loan status.

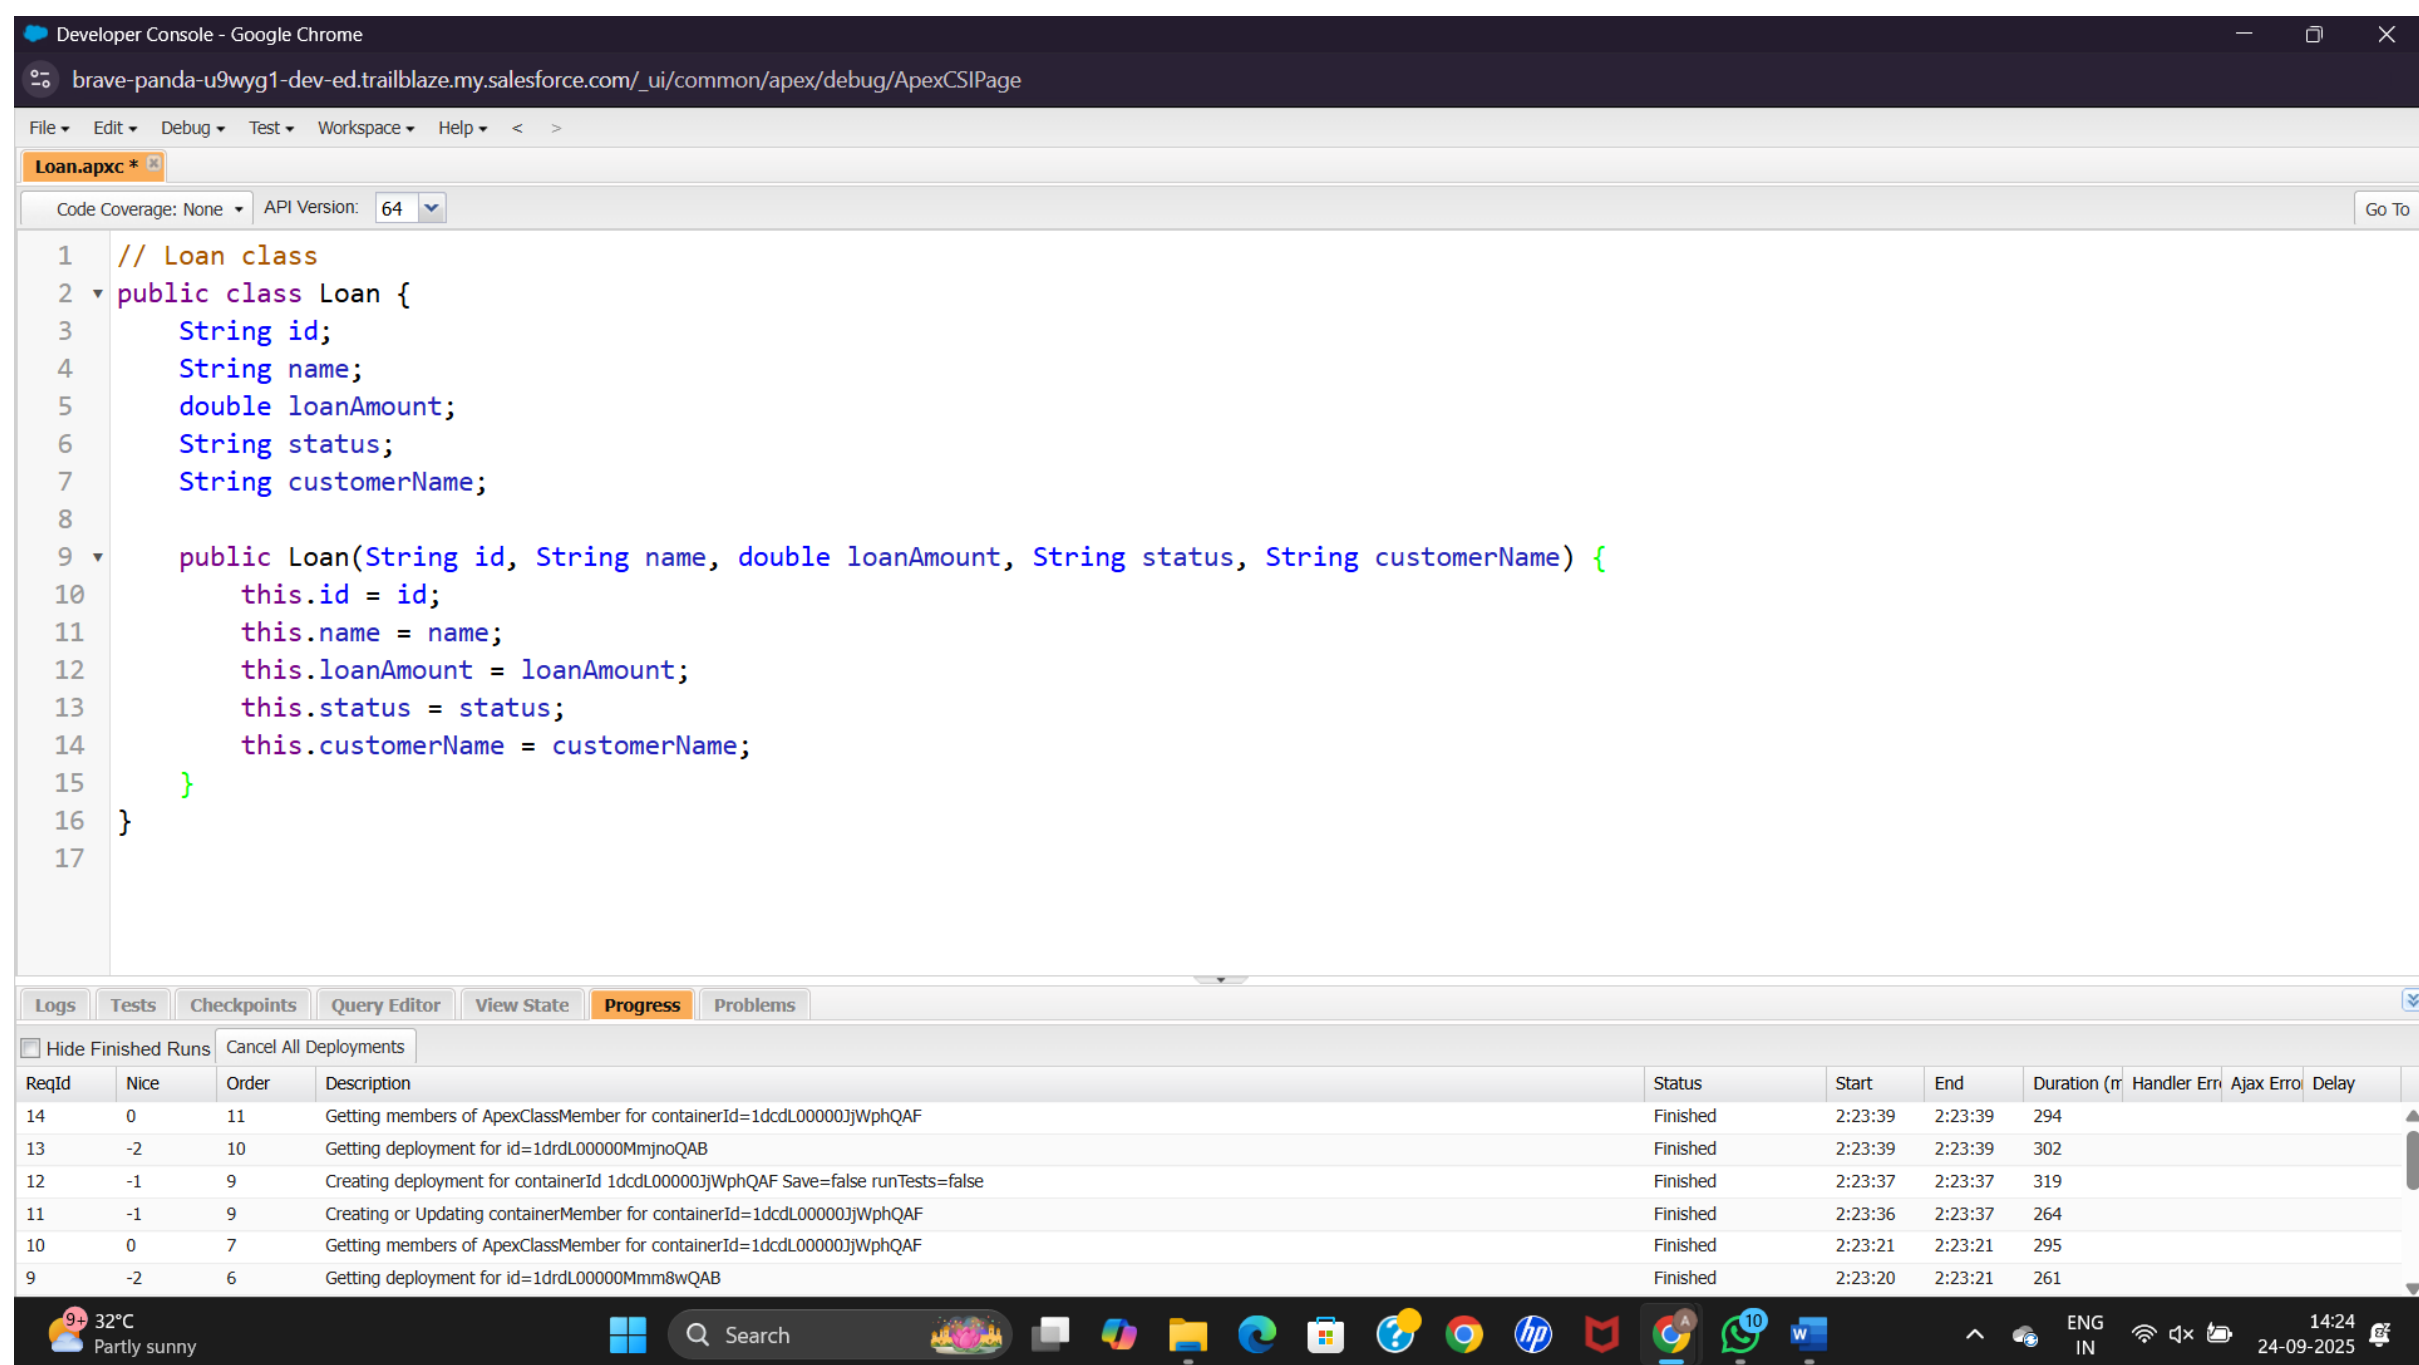

3.Trigger Design Platform:

An Apex Trigger is a piece of code on the Salesforce Platform that executes automatically before or after records are inserted, updated, deleted, or undeleted.

- . **Trigger.new / Trigger.old** → access new and old record values.
- . **Trigger.isBefore / Trigger.isAfter** → control execution timing.
- . **Bulkified operations** → handle multiple records efficiently.
- . **Integration with Apex Classes** → keeps trigger logic clean.

4.SOQL & SOSL:

- . **SOQL** → Use when querying specific objects/fields.
- . **SOSL** → Use for global searches across multiple objects.
- . SOSL is used to search text, email, and phone fields across multiple objects simultaneously.
- . Returns records that match the search term.
- . SOQL is used to query Salesforce records from a single object or related objects.

- . Similar to SQL, but designed specifically for Salesforce objects.

5.Control Statements:

Control statements are used to **control the flow of execution** in Apex code. They allow conditional execution, looping, and decision-making in your Salesforce programs.

- Conditional statements validate **loan criteria, customer eligibility, or account status**.
- Loops process **lists of loans, accounts, or service requests** in bulk.
- Jump statements help optimize **batch processing** and avoid unnecessary operations.

6.Batch Apex:

- . Batch Apex is used to process large volumes of records asynchronously in Salesforce.
- . It splits records into manageable chunks (batches) and processes them in the background.

- Useful when operations exceed governor limits in Salesforce.
- Automatically update or process **thousands of loan, account, or service request records**.
- Examples:
 - Recalculate EMI for all loans at month-end.
 - Update loan statuses for overdue payments.
 - Send mass notifications or tasks to Relationship Managers.

```

1 //Batch Apex
2 public class LoanBatchProcess implements Database.Batchable<SObject> {
3
4     // Start method: query all Loan records
5     public Database.QueryLocator start(Database.BatchableContext BC) {
6         return Database.getQueryLocator(
7             'SELECT Id, Name FROM Loan__c' // Only selecting Id and Name
8         );
9     }
10
11     // Execute method: process each batch of loans
12     public void execute(Database.BatchableContext BC, List<Loan__c> scope) {
13         // Example logic: just log the loan names
14         for (Loan__c loanRecord : scope) {
15             System.debug('Processing Loan: ' + loanRecord.Name);
16         }
17     }
18 }
19
20

```

7. Asynchronous Processing:

Asynchronous processing allows code to run in the background without blocking the user interface. It is used for operations that are time-consuming, involve large data volumes, or external callouts.

- Processing thousands of loan records.
- Sending bulk notifications to Relationship Managers or customers.
- Performing complex calculations like EMI schedules or interest recalculations.
